## Fund description

The fund pursues total return by investing in a broad mix of bond sectors that management believes will benefit from changes in economic and market conditions. U.S. government and investment-grade corporate bonds predominate, with limits on exposure to domestic high-yield and both developed and emerging international sectors.

Performance quoted represents past performance, which is no guarantee of future results. Investment return and principal value will fluctuate so that an investor's shares, when redeemed, may be worth more or less than their original cost. Current performance may be lower or higher than what is stated. To view performance current to the most recent month-end, and for after-tax returns, contact us or visit [FederatedHermes.com/us](https://FederatedHermes.com/us). Maximum offering price figures reflect the maximum sales charge of 4.5% for A Shares. See the prospectus for other fees and expenses that apply to a continued investment in the fund. Total returns for periods of less than one year are cumulative.

\* The fund's expense ratio is from the most recent prospectus. The expense ratio may reflect voluntary fee waivers and/or expense reimbursements determined by the fund's Advisor and its affiliates. The voluntary waivers and/or reimbursements, if applicable, are in effect up to but not including the later of 2/1/25 or the date of the fund's next effective prospectus.

Not FDIC Insured • May Lose Value • No Bank Guarantee

# Investment approach

### Core Plus, Intermediate Bond Fund

- A disciplined approach to core fixed income with a conservative, investment-grade risk profile
- Invests primarily in U.S. government, mortgage-backed and investment-grade corporate fixed income with modest exposure to sectors such as high yield and emerging markets debt
- May invest in below investment-grade securities up to 25%

### Consistent, repeatable investment process

- Combines top-down decision making with bottom-up security selection to build diversified, risk-managed portfolios
- Key decision teams known as “alpha pods” seek diversified, uncorrelated alpha sources across various market environments
- Positioning set across five factors: sector allocation, security selection, duration management, yield curve strategy and currency management

### Tenured team with long-term results

- Team-based approach focused by sector to extract value from each step of the process
- Federated Hermes’ fixed-income philosophy and process has a 50-year heritage
- Senior fixed-income management team averages 27 years of experience, and team members have worked together at Federated Hermes for 17 years

As of 6/30/24

## Quality breakdown<sup>1</sup> (%)

Quality breakdown does not apply to Equity or Cash/Cash Equivalents.

Portfolio composition is based on net assets at the close of business on 6/30/24 and may not necessarily reflect adjustments that are routinely made when presenting net assets for formal financial statement purposes. Because this is a managed portfolio, the investment mix will change.

## Highlights

- R6 shares returned 0.18% in the quarter, compared to 0.07% for the Bloomberg US Aggregate Bond Index (BAB)
- Small allocations to out-of-index trade finance loans and high-yield bonds added slightly to returns
- A yield curve steepener added modestly to returns
- Security selection in investment-grade (IG) corporates, mortgage-backed securities (MBS) and emerging markets (EM) added to returns
- Duration positioning was slightly detractive
- To begin the third quarter, the fund's overall duration is in-line with the BAB, but with a bias for short and intermediate-maturity bonds to outperform longer-maturity bonds. The fund is neutral weight IG corporate bonds, overweight MBS, underweight commercial mortgage-backed securities (CMBS), and continues to hold small allocations to EM bonds, trade finance loans and high-yield bonds

## Looking back

In the second quarter, interest rates initially rose on fears that the first quarter rebound in inflation would prevent the Federal Reserve (Fed) from easing monetary policy. The 10-year Treasury yield increased from 4.20% to 4.70% during April. However, a deceleration in the rate of inflation and weaker readings on retail sales and housing, as well as a slow but steady grind higher in the unemployment rate, enabled the 10-year Treasury yield to fall back to 4.40% by quarter-end.

Credit spreads were relatively stable during the second quarter after several quarters of tightening. Nonetheless, most sectors of the bond market still managed to outperform Treasuries due to having higher yields than Treasuries. The best performing sectors, in order of decreasing excess returns relative to comparable duration Treasuries, were EM bonds, trade finance loans, bank loans, high-yield bonds, CMBS, asset-backed securities, MBS and IG corporate bonds. Within the corporate bond market, financials significantly outperformed utilities and industrials, and within MBS, 30-year maturities outperformed 15-year maturities.

## Performance

Federated Hermes Total Return Bond Fund R6 Shares posted a total return net of fees of 0.18% for the quarter. The performance compares to a return of 0.07% for the BAB. The fund's total return for the period also reflected actual cash flows, transaction costs and other expenses that were not reflected in the total return of the BAB.

### Performance contributors

- Small allocations to out-of-index trade finance loans and high-yield bonds
- Yield curve steepener
- Security selection in IG corporates, MBS and EM bonds

### Performance detractors

- Duration positioning

*Performance data quoted represents past performance, which is no guarantee of future results. ## How we are positioned

During the second quarter, the fund increased its allocation to IG corporate bonds from 25% to 27%. The fund also increased allocation to MBS from 29% to 31% and added a 3.4% position in MBS collateralized mortgage obligation floaters, which yield 6.5% with no credit risk. Treasuries were reduced from 30.5% to 27% in order to fund these additional allocations. EM bonds held steady at 5.5% of the fund, as did trade finance loans (5%), high-yield bonds (2.7%) and bank loans (0.7%).

The fund's overall duration was similar to the BAB. The fund is, however, overweight 2 and 5-year maturity bonds and underweight 10 and 30-year maturity bonds (a yield curve steepener). If the economy stays resilient and inflation stalls above the Fed's 2% target, the market may price in a higher term premium at the long end of the curve to compensate investors for increased inflation risk. On the other hand, should the economy weaken and inflation fall, the market would likely price in more and faster Fed rate cuts, resulting in shorter-maturity rates falling faster than longer-maturity rates.

The fund employed derivatives to both hedge risk and to express duration, yield curve, and currency investment themes during the quarter. Derivatives are used when they are less expensive or more efficient than physical securities to express investment themes from Federated Hermes' Alpha Pod process.

Past performance is no guarantee of future results. Rankings are based on total return and do not take sales charges into account.

<sup>1</sup>The ratings referred to in the quality breakdown are provided by S&P Global Ratings, Moody's, and Fitch. The allocation of ratings presented aligns with the methodology of the Bloomberg index. Bloomberg employs the middle rating from S&P Global Ratings, Moody's, and Fitch to determine a security's credit classification, essentially following a "two-out-of-three" rule. In cases where only two agencies rate a security, the more conservative (lower) rating is utilized. If only one agency rates a security, that single rating is used. Additionally, certain securities may not have a credit rating from any of the agencies, and they are categorized as "not rated." For clarity, credit ratings of A or better are indicative of high credit quality, while BBB represents good credit quality and the lowest tier of investment grade. Ratings of BB and below are assigned to lower-rated securities, often referred to as "junk bonds," and credit ratings of CCC or below indicate a high level of default risk. This breakdown doesn't consider the impact of credit derivatives in the fund.

30-day yield (also known as "SEC yield") for A Shares is a compounded and annualized figure calculated according to a formula set by the SEC. The formula requires use of a specific methodology for calculating dividends and interest earned, and expenses accrued, during the period, and reflects the maximum offering price per fund share. The standardized computation is designed to facilitate yield comparisons among different funds. In the absence of temporary expense waivers or reimbursements, the 30-day yield would have been 4.18% at maximum offering price for A Shares, 4.95% for R6 Shares, and 4.90% for Institutional Shares.

The fund's R6 Shares commenced operations on April 17, 2015. For the period prior to the commencement of operations of the R6 Shares, the performance information shown is for the fund's Institutional Shares, adjusted to reflect the expenses of the R6 Shares for each year for which the expenses of the R6 Shares would have exceeded the actual expenses paid by the Institutional Shares.

## Federated Hermes Total Return Bond Fund

### A word about risk

Mutual funds are subject to risks and fluctuate in value.

High-yield, lower-rated securities generally entail greater market, credit/default and liquidity risks, and may be more volatile than investment-grade securities.

Bond prices are sensitive to changes in interest rates, and a rise in interest rates can cause a decline in their prices.

The value of some mortgage-backed securities may be particularly sensitive to changes in prevailing interest rates, and although the securities are generally supported by some form of government or private insurance, there is no assurance that private guarantors or insurers will meet their obligations.

### Definitions

**Alpha** shows how much or how little return is generated, given the risk a portfolio takes. A portfolio with an alpha greater than 0 has earned more than expected given its beta—meaning the portfolio has generated excess return without increasing risk. A portfolio with a negative alpha is producing a lower return than would be expected given its risk.

**Beta** measures a portfolio's volatility relative to the market. A beta greater than 1.00 suggests the portfolio has historically been more volatile than the market as measured by the fund's benchmark. A beta less than 1.00 suggests the portfolio has historically had less volatility relative to the market.

**Sharpe ratio** is calculated by dividing a fund's annualized excess return by the fund's annualized standard deviation. The higher the Sharpe ratio, the better the fund's historical risk adjusted performance.

**Standard deviation** is a historical measure of the variability of returns relative to the average annual return. A higher number indicates higher overall volatility.

**Up capture ratio/down capture ratio** is a measure of how well a manager was able to replicate or improve on periods of positive benchmark returns and how badly the manager was affected by periods of negative benchmark returns. The up-market capture ratio is a measure of a manager's performance in up markets relative to the index during the same period. For example, a ratio value of 115 indicates that the manager has outperformed the market index by 15% in periods when the index has risen. The down-market capture ratio is the direct opposite of the up-market capture ratio, gauging performance of the manager relative to the index in down markets. A ratio value of 80 would indicate the manager had declined on 80% as much as the declining overall market, indicating relative outperformance.

**Weighted average bond price** is the weighted average of all individual bond prices within a portfolio.

**Weighted average coupon** is the weighted average interest payment of all individual debt securities within a portfolio.

**Weighted average effective duration** (sometimes called "Option-Adjusted Duration") is a measure of a security's price sensitivity to changes in interest rates calculated using a model that recognizes that the probability of a bond being called or remaining outstanding until maturity may vary if market interest rates change, and that makes adjustments based on a bond's embedded options (e.g., call rights, or in the case of a mortgage-backed security, the probability that homeowners will prepay their mortgages), if any, based on the probability that the

options will be exercised. A fund's weighted average effective duration will equal the market value weighted average of each bond's effective duration in the fund's portfolio. As with any model, several assumptions are made so the weighted average effective duration of a fund in the Federated Hermes family of funds may not be comparable to other funds outside of the Federated Hermes family of funds. Securities with longer durations are more sensitive to changes in interest rates than securities of shorter durations.

**Weighted average effective maturity** is the average time to maturity of debt securities held in the fund.

**Weighted average yield to maturity** is used to determine the rate of return an investor would receive if a long-term, interest-bearing investment, such as a bond, is held to its maturity date. It takes into account purchase price, redemption value, time to maturity, coupon yield and the time between interest payments.

**Bloomberg US Aggregate Bond Index** is an unmanaged index composed of securities from the Bloomberg Government/Corporate Bond Index, the Mortgage-Backed Securities Index and the Asset-Backed Securities Index. Total return comprises price appreciation/depreciation and income as a percentage of the original investment. Indices are rebalanced monthly by market capitalization.

**Bloomberg US Universal Index** represents the union of the US Aggregate Index, US Corporate High-Yield, Investment Grade 144A Index, Eurodollar Index, US Emerging Markets Index and the non-ERISA eligible portion of the CMBS Index. The index covers USD denominated, taxable bonds that are rated either investment grade or below investment grade.

**Russell Top 200® Index** measures the performance of the largest cap segment of the U.S. equity universe. The Russell Top 200® Index is a subset of the Russell 3000® Index. It includes approximately 200 of the largest securities based on a combination of their market cap and current index membership and represents approximately 68% of the U.S. market. The Russell Top 200® Index is constructed to provide a comprehensive and unbiased barometer for this very large cap segment and is completely reconstituted annually to ensure new and growing equities are reflected.

Indexes are unmanaged and cannot be invested in directly.
