30-day yield (R6)	4.42
30-day yield (IS)	4.41
30-day yield (SS)	4.30
30-day yield (A)	4.26

## Fund description

The fund seeks total return consistent with current income by investing primarily in a diversified portfolio of investment-grade debt, including asset- and mortgage-backed, corporate, Treasury and government-agency securities. Its portfolio is invested in sectors that offer the best risk/return balance, while maintaining a weighted average effective duration of one year or less.

## Quality breakdown<sup>1</sup> (%)

Quality breakdown does not apply to Equity or Cash/Cash Equivalents.

Portfolio composition is based on net assets at the close of business on 3/31/26 and may not necessarily reflect adjustments that are routinely made when presenting net assets for formal financial statement purposes. Because this is a managed portfolio, the investment mix will change.

## Highlights

- Fund performance reflected an increase in short-term market yields, which finished the quarter higher as the rate on the US two-year Treasury note increased from 3.47% at 12/31/25 to 3.79% at 3/31/26
- Short-term credit spreads widened during the quarter. The spread (option-adjusted) on the Bloomberg 1-3 Year Corporate Index (B1-3CI) increased from 51 basis points (bps) at 12/31/25 to 61 bps at 3/31/26. Similarly, the spread on the Bloomberg Asset-Backed (ABS) Index rose from 52 to 53 bps over the course of the reporting period
- The Federal Reserve (Fed) kept rates unchanged during the first quarter of 2026, as the target rate remains 3.50%–3.75%. While the future path of rates is uncertain, we continue to believe that the next move from the Fed will most likely be an easing of monetary policy

## Looking back

Fund performance was positive in the first quarter despite an increase in front-end rates. The fund's exposure to spread product benefitted performance as both corporate and ABS bonds provided additional income over comparable duration government securities. The yield on the two-year Treasury note increased from 3.47% at 12/31/25 to 3.79% by 3/31/26. The fund's capital value decreased by \$0.04 over the quarter, moving from \$9.32 at 12/31/25 to \$9.28 at 3/31/26. Even with modest widening during the period, short corporate bonds (B1-3CI increased from 0.51% on 12/31/2025 to 0.61% on 3/31/2026) outperformed comparable duration government securities through income generated during the quarter. Similarly, ABS spreads (Bloomberg ABS Index) widened by 1 bp, ending the quarter at 0.53%. Nonetheless, the carry from these bonds also supported the performance of the portfolio. Credit spreads experienced periods of volatility during the quarter, driven primarily by elevated geopolitical uncertainty, including escalating tensions in the Middle East and the ongoing conflict involving Iran. New issue supply was also heavy across investment grade corporates and ABS; however, strong investor demand for high quality assets allowed the market to absorb this issuance effectively.

The average duration of the fund during the quarter was 0.93 years, longer than that of the fund's competitive benchmark, the Bloomberg Short-Term Government/Corporate Index (BSTGCI), which averaged 0.50 years. Management continues to position the fund with this duration bias relative to the benchmark, reflecting the view that the Fed remains in an easing cycle despite inflation readings that are still above the Fed's 2% target. As a result, portfolio duration remains above the midpoint of the fund's normal 0.4–1.0 year target range.

## Performance

Federated Hermes Ultrashort Bond Fund's return on IS Shares at net asset value (NAV) for the first quarter was 0.69%, versus returns on the ICE Bank of America Merrill Lynch 1-Year Treasury Bill Index of 0.63% and the BSTGCI of 0.79%. The average return for the Lipper Ultrashort Bond category was 0.77%.

### Performance contributors

- The sector allocation added 24 bps (gross of fund expenses). The outcome reflected the fund's bias toward out-of-index credit-sensitive securities, particularly ABS, in an environment in which the spread on these securities provided positive carry

### Performance detractors

- The fund's interest-rate positioning, combining both duration and yield curve (i.e., holding certain securities with maturities either shorter or longer than that of the benchmark in an increasing yield environment) subtracted 7 bps (gross of fund expenses) of performance relative to the benchmark. The fund's duration was consistently longer than that of the benchmark throughout the quarter during which front-end rates increased
- Security selection subtracted 18 bps (gross of fund expenses) in excess return, as some holdings underperformed their portion of the benchmark

*Performance quoted represents past performance, which is no guarantee of future results. Investment return and principal value will fluctuate so that an investor's shares, when redeemed, may be worth more or less than their original cost. ## How we are positioned

The Federated Hermes Ultrashort Bond Fund's investment philosophy reflects the belief that in all but the most difficult of environments, the income earned by utilizing a modestly credit-oriented portfolio should be able to more than offset capital fluctuation and provide a return which exceeds that of a more conservative cash investment. This proved to be difficult during the first quarter as the fund underperformed a non-credit comparable, the Treasury component of the BSTGCI (0.79% return). Even with the modest spread widening during the quarter and periods of increased spread volatility, the fund's general overweight to credit remains in place, while exposure to investments in lower-quality credit has been repositioned to a more neutral level relative to long-term allocations. Interest-rate sensitivity has been raised to levels higher than the general fund midpoint of 0.4–1.0 years (as well as remaining long of the benchmark index) as the Fed has progressed further into its easing cycle. We still believe high-quality corporate and ABS securities will offer attractive carry (i.e., yield income) which can result in a positive contribution to total return for the portfolio.

## Federated Hermes Ultrashort Bond Fund

<sup>1</sup> The ratings agencies that provided the ratings are S&P Global Ratings, Moody's and Fitch. When ratings vary, the highest rating is used. Credit ratings of A or better are considered to be high credit quality; credit ratings of BBB are good credit quality and the lowest category of investment grade; credit ratings BB and below are lower-rated securities ("junk bonds"); and credit ratings of CCC or below have high default risk. The credit quality breakdown does not give effect to the impact of any credit derivative investments made by the fund.

30-day yield (also known as "SEC yield") for A Shares is a compounded and annualized figure calculated according to a formula set by the SEC. The formula requires use of a specific methodology for calculating dividends and interest earned, and expenses accrued, during the period, and reflects the maximum offering price per fund share. The standardized computation is designed to facilitate yield comparisons among different funds. In the absence of temporary expense waivers or reimbursements, the 30-day yield would have been 4.17% for A Shares, 4.38% for R6 Shares, 4.34% for Institutional Shares, and 4.23% for Service Shares.

Prior to October 27, 1998, the fund was named Federated Limited Duration Government Fund with an investment concentration in government securities. The fund was reconfigured to maintain an ultrashort duration (one year or less) with a revised investment policy of purchasing both higher and lower quality fixed income securities.

The fund's A Shares commenced operations on October 8, 2002. For the period prior to the commencement of operations of the A Shares, the performance information shown is for the fund's Service Shares, adjusted to reflect the sales charges (for maximum offering price performance) that were applicable to the fund's A Shares until December 1, 2019 and expenses of the A Shares.

The fund's R6 Shares commenced operations on May 29, 2019. For the periods prior to the commencement of operations of the R6 Shares, the performance information shown is for the fund's Institutional Shares. The performance of the Institutional Shares has not been adjusted to reflect the expenses applicable to the R6 Shares since the R6 Shares have a lower expense ratio than the expense ratio of the Institutional Shares.

The fund may invest in Federated Hermes portfolios that are not available to the public and provide for more effective diversification than is available through the purchase of individual securities. Where applicable, the fund holdings reflect exposure to underlying securities held by the portfolios.

### A word about risk

Mutual funds are subject to risks and fluctuate in value.

Bond prices are sensitive to changes in interest rates, and a rise in interest rates can cause a decline in their prices.

The fund is not a "money market" mutual fund. Some money market mutual funds attempt to maintain a stable net asset value through compliance with relevant Securities and Exchange Commission (SEC) rules. The fund is not governed by those rules, and its shares will fluctuate in value.

The value of some mortgage-backed securities may be particularly sensitive to changes in prevailing interest rates, and although the securities are generally supported by some form of government or private insurance, there is no assurance that private guarantors or insurers will meet their obligations.

High-yield, lower-rated securities generally entail greater market, credit/default and liquidity risks, and may be more volatile than investment-grade securities.

### Definitions

**Alpha** shows how much or how little return is generated, given the risk a portfolio takes. A portfolio with an alpha greater than 0 has earned more than expected given its beta—meaning the portfolio has generated excess return without increasing risk. A portfolio with a negative alpha is producing a lower return than would be expected given its risk.

**Sharpe ratio** is calculated by dividing a fund's annualized excess return by the fund's annualized standard deviation. The higher the Sharpe ratio, the better the fund's historical risk adjusted performance.

**Standard deviation** is a historical measure of the variability of returns relative to the average annual return. A higher number indicates higher overall volatility.

**Weighted average bond price** is the weighted average of all individual bond prices within a portfolio.

**Weighted average effective duration** (sometimes called "option-adjusted duration") is a measure of a security's price sensitivity to changes in interest rates calculated using a model that recognizes that the probability of a bond being called or remaining outstanding until maturity may vary if market interest rates change, and that makes adjustments based on a bond's embedded options (e.g., call rights, or in the case of a mortgage-backed security, the probability that homeowners will prepay their mortgages), if any, based on the probability that the options will be exercised. A fund's weighted average effective duration will equal the market value weighted average of each bond's effective duration in the fund's portfolio. As with any model, several assumptions are made so the weighted average effective duration of a fund in the Federated Hermes family of funds may not be comparable to other funds outside of the Federated Hermes family of funds. Securities with longer durations are more sensitive to changes in interest rates than securities of shorter durations.

**Weighted average effective maturity** is the average time to maturity of debt securities held in the fund.

**Weighted average spread duration** is the average of the spread durations of the underlying securities.

**Yield curve** is a graph showing the comparative yields of securities in a particular class according to maturity. Securities on the long end of the yield curve have longer maturities.

**Bloomberg US Short-Term Government/Corporate Index** represents securities that have fallen out of the US Government/Corporate Index because of the standard minimum one year maturity constraint. Sectors include treasuries, agencies, industrials, utilities and financial institutions.

Indexes are unmanaged and cannot be invested in directly.
