

## The case for active ETFs

Owning an index fund may limit your ability to respond to current conditions and to seek lower downside risk during periods of market volatility. Active managers have flexibility to seek investment opportunities to attempt to beat their benchmark. Combining that flexibility with an ETF vehicle structure provides investors more options to strategically manage critical concerns such as risk exposure and taxes.

### Active ETFs offer:

#### 1. Outperformance potential

Active managers aim to beat their benchmarks using research, expertise, innovative technologies and more.

#### 2. Help retain more of any gain

With the potential for better tax efficiency and smaller capital gains distributions, active ETFs offer the opportunity to rethink how you build and allocate your taxable portfolio.

#### 3. Lower downside risk potential

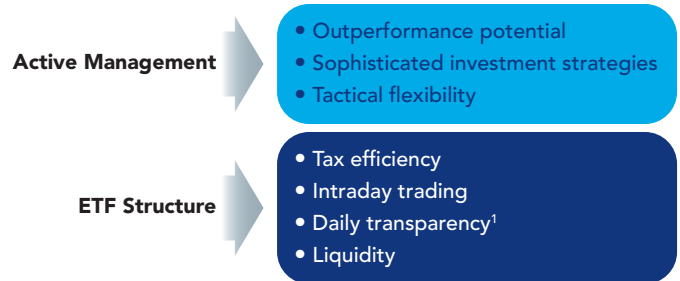

To mitigate portfolio risk, active equity managers can avoid overvalued market sectors, raise cash and employ diversification strategies. Active fixed income managers can seek to mitigate risk through sector rotation, shortening or extending duration and active yield curve positioning.

#### 4. Informed flexibility

Investors in active ETFs can use ETFs' holdings transparency and intraday trading to make more informed, real-time asset allocation decisions.

#### 5. A liquid investment vehicle

Active ETFs have added liquidity potential because they can be traded even when their underlying securities are not. Investors can use liquidity to trade ETFs like stocks, quickly and efficiently throughout the day.

### Active ETFs taking off

38% of investors in the U.S. plan to increase exposure to active ETFs in the next 12 months.

Total active ETF assets as of 8/31/23: \$441.3 billion (fixed income: \$157.2; equity \$230.3; other \$53.8). Sources: Federated Hermes analysis and Morningstar, Inc. Professional ETF investors are 386 financial advisors, institutional investors and fund managers from the U.S., Europe and Greater China who invest in ETFs and were surveyed by Brown Brothers Harriman. Data as of January 2023. Source: Brown Brothers Harriman. 2023 Global ETF Investor Survey, 2023 [Survey].

**Founded in 1955, Federated Hermes is a leading global investment manager with \$704 billion in assets under management as of 6/30/23. Our active management has helped clients achieve investment goals such as wealth creation, income generation, sustainable outcomes and more.**

Please carefully read the summary prospectus or the prospectus before investing.**

Fund shares are bought and sold on an exchange at market price (not NAV) and are not individually redeemed from the Fund. However, shares may be redeemed at NAV directly by certain authorized broker-dealers (Authorized Participants) in very large creation/redemption units. Shares may trade at a premium or discount to their NAV in the secondary market. Brokerage commissions will reduce returns. Market price returns are based on the official closing price of an ETF share or, if the official closing price isn't available, the midpoint between the national best bid and national best offer ("NBBO") as of the time the ETF calculates the current NAV per share. NAVs are calculated using prices as of 4:00 PM Eastern Time.

Although the information provided in this document has been obtained from sources which Federated Hermes Investors believes to be reliable, it does not guarantee accuracy of such information and such information may be incomplete or condensed.

#### **A word about risk**

Active ETFs typically have higher fees than passive ETFs, which can reduce performance.

Bond prices are sensitive to changes in interest rates, and a rise in interest rates can cause a decline in their prices.

There are no guarantees that dividend-paying stocks will continue to pay dividends. In addition, dividend-paying stocks may not experience the same capital appreciation potential as non-dividend-paying stocks.

High-yield, lower-rated securities generally entail greater market, credit/default and liquidity risks, and may be more volatile than investment grade securities.

Issuers of fixed-income securities may fail to pay interest or principal on those securities when due, which may reduce the value of a Fund's portfolio holdings, its share price and its performance.

Diversification does not assure a profit nor protect against loss.

<sup>1</sup> Many active ETFs offer daily transparency, however, active semi-transparent or active non-transparent ETFs do not.

#### **A note about ETF liquidity**

ETFs have multiple liquidity providers—authorized participants, broker-dealers and the secondary market—that can help provide liquidity.

An authorized participant (AP) is an authorized broker-dealer that has the right to create and redeem shares of an exchange traded fund (ETF). They provide a large portion of the liquidity in the ETF market by purchasing the securities required to create the shares of an ETF and delivering them to the ETF's sponsor, who creates the ETF shares. APs also help ETF sponsors redeem shares, by selling the securities that an ETF sponsor needs to sell to redeem ETF shares. APs increase liquidity of an ETF because of the mutually beneficial relationship between APs and ETF sponsors—while APs are not compensated directly, they can profit from trading the ETFs underlying securities on the secondary market. APs help keep ETF prices close to their net asset values (NAVs). Another benefit of the liquidity added by the ETF creation and redemption process is that it allows investors to trade ETFs in large amounts without significantly affecting the ETF's price, regardless of the ETF's size or trading volume.

Broker-dealers who are not acting as APs can provide added ETF liquidity by contacting ETF sponsors or APs directly to redeem or create ETF shares. These broker-dealers can sell ETF shares directly on the secondary market.

On the secondary market, market participants provide liquidity by trading ETF shares as securities.

#### **A note about the tax efficiency of ETFs**

ETFs can be tax-efficient because of their unique structure, which involves using an in-kind trading process, meaning that managers trade securities in "units," also known as blocks or baskets of securities, which are exempt from capital gains due to a tax law that rules that funds can avoid triggering a tax event by trading in-kind, rather than in cash. When investors sell shares, which could normally trigger a tax event (such as capital gains tax on profits), investors either trade the ETF in-kind to one another on the secondary market or ETF managers redeem the shares by transacting in units, with the help of APs. If these transactions are in-kind rather than cash, which they typically are, no tax event is triggered.
